

-DIY Compost Bin-

Materials Needed:

- Bin
- Soil
- Leaf litter
- Shredded paper
- Food Scraps
- Worms (Optional)
- Drill (Only with lid)

Instructions:

1. Grab your bin and fill with soil leaf litter and the other materials you gathered. You should have the ratio of natural decomposing materials (leaf litter, soil, wood shavings, etc) to food scraps 20 to 1. Which means for every 1 part of food, you should have 20 times as much natural decomposing material.
2. If you decide to have a lid on your compost bin, you need to make sure that you drill holes in your compost bin. It's important that your compost bin has good access to oxygen to decompose properly.
